

# Signal Generator MS 1000

---

The Signal Generator MS 1000 is an universal RF signal source with wide frequency range and comprehensive modulation capabilities. The RF output frequency is directly derived from the internal highly stable OCXO reference oscillator, which ensures superior frequency accuracy.

All instrument settings can be entered easily by the numeric keyboard and the softkeys. A quasi-continuous rotary control knob allows simply modification of the selected parameters with free selectable delta-steps.

Comprehensive modulation modes are provided for testing all types of receivers. An internal modulation oscillator, an external signal or both of them can be used for modulation. The internal AF source generates a variety of waveforms, sine-wave, square-wave, triangle and saw-tooth.

The MS 1000 provides most of the international tone signalling standards for applications in radio communications. Double-tone, analog sel-call (17 standards), digital sel-call (3 standards) and subaudio-tone encoders are available as options. The POCSAG encoder (option) allows pager testing with various modes, tone-only, numeric and alphanumeric. In the alphanumeric mode all ASCII characters can be generated.

A large dot matrix LCD screen with switchable backlighting offers an excellent contrast to display all instrument parameters. A simple softkey-menu operating system can be used to configure the MS 1000 to the user's required test application. Up to 100 complete instrument settings can be stored in a non-volatile memory.

The IEEE-Bus interface is fitted as standard to remote control all instrument settings over the bus. This allows the application of MS 1000 in ATE-systems.

The instrument can be powered from AC mains supply or from an external DC battery for applications in areas where a stable AC supply is not guaranteed.
